

# Custom Labels

## Tailored To Your Operating Room Needs

**Codonics Safe Label System (SLS)** is a first-in-its-class solution that brings automation, compliance, and safety to the point of care. SLS is an "FDA-cleared" Class II medical device intended for safe and effective automatic verification of drug identity using barcode data from NDC and other drug vial UDI barcodes. The system enables the creation of compliant drug class color-coded ISO26825 and ASTM 4774 labels while adhering to TJC-MM & ISMP medication standards in alignment with ASA, APSP, and TJC medication safety guidance & goals to enhance medication safety. But syringe labeling is just the beginning.

**With SLS, facilities unlock powerful flexibility**—enabling **fully customized, on-demand labels** for IV lines, invasive monitors, patient samples, airway alerts, high-risk medications, and more. Whether you're managing a complex case in the OR or organizing high-acuity workflows in the ICU, SLS empowers your team to improve communication, reduce risk, and drive consistency across every touchpoint.

**Custom labels** are designed to match your hospital's unique clinical needs and environment.

- Clear, color-coded labels that improve communication a glance
- Durable design for high-demand clinical environments — won't smudge, curl, or peel
- Standardizes labeling across the OR and ICU — supporting safety, speed, and team communication

**Codonics SLS empowers facilities to enhance safety, efficiency, and compliance with fully customizable labeling solutions.**

For example, a "DIFFICULT INTUBATION" label can be printed and placed on a patient's forehead to alert clinicians of a complex airway case, or "GAUGE LABELS" can be used to clearly indicate the gauge size on an IV.
